

1. A surface is defined by the vector function

$$\mathbf{r}(s, t) = [s^2 \cos t \quad s^2 \sin t \quad s]^T$$

- Evaluate the normal vectors to the surface at $(1, 0, -1)$.
- Determine the Cartesian equation of the tangent plane at $(1, 0, -1)$.
- Determine the Cartesian equation of the surface in the form $F(x, y, z) = 0$.

ANS: a) $\mathbf{N} = \pm[1 \quad 0 \quad 2]^T$. b) $x + 2z = -1$. c) $x^2 + y^2 - z^4 = 0$.

$$a) \quad \vec{r}_s = \begin{pmatrix} 2s \cos t \\ 2s \sin t \\ 1 \end{pmatrix} \quad \vec{r}_t = \begin{pmatrix} -s^2 \sin t \\ s^2 \cos t \\ 0 \end{pmatrix}$$

$$\begin{aligned} \vec{N} &= \vec{r}_s \times \vec{r}_t = \begin{pmatrix} -s^2 \cos t \\ -s^2 \sin t \\ 2s^3 \cos t + 2s^3 \sin^2 t \end{pmatrix} \\ &= \begin{pmatrix} -s^2 \cos t \\ -s^2 \sin t \\ 2s^3 \end{pmatrix} \end{aligned}$$

$$\text{At } \begin{pmatrix} 1 \\ 0 \\ -1 \end{pmatrix} \begin{matrix} \rightarrow s^2 \cos t = 1 \\ \rightarrow s = -1 \\ \rightarrow t = 0 \end{matrix}, \quad \vec{N} \text{ at } \begin{pmatrix} 1 \\ 0 \\ -1 \end{pmatrix} = \begin{pmatrix} -1 \\ 0 \\ -2 \end{pmatrix}$$

2. Evaluate the flux of the vector field below across the triangular surface S that is the plane $2x - 2y + z = 2$ cut out by the coordinate planes. The surface is orientated with an upward-pointing normal.

$$z = 2 - 2x + 2y$$

$$\mathbf{F}(x, y, z) = [x \ y \ z]^T$$

ANS: Flux = 1.

parameterize surface S

$$\vec{r}(x, y) = \begin{pmatrix} x \\ y \\ 2 - 2x + 2y \end{pmatrix}$$

$$\vec{N} = \vec{r}_x \times \vec{r}_y = \begin{pmatrix} 1 \\ 0 \\ -2 \end{pmatrix} \times \begin{pmatrix} 0 \\ 1 \\ 2 \end{pmatrix}$$

$$= \begin{pmatrix} 2 \\ -2 \\ 1 \end{pmatrix} \leftarrow \text{upwards}$$

$$\vec{F} \cdot \vec{N} = \begin{pmatrix} x \\ y \\ 2 - 2x + 2y \end{pmatrix} \cdot \begin{pmatrix} 2 \\ -2 \\ 1 \end{pmatrix}$$

$$= 2x - 2y + 2 - 2x + 2y$$

$$= 2$$

$$\text{Flux} = \iint \vec{F} \cdot \vec{N} \, dx \, dy = \int_{-1}^0 \int_0^{y+1} 2 \, dx \, dy$$

$$= \int_{-1}^0 [2y + 2] \, dy$$

$$= [y^2 + 2y] \Big|_{-1}^0$$

$$= 0 - (1 - 2)$$

$$= \underline{\underline{1}}$$

4. A surface $S = S_1 + S_2$ that looks like a funnel is shown below.

- Determine the outward-pointing normals of surfaces S_1 and S_2 .
- Evaluate the flux of \mathbf{F} below through S , which is orientated by outward-pointing normals.

$$\mathbf{F}(x, y, z) = [-y \quad x \quad z]^T$$

ANS: a) $S_1 : \mathbf{N} = [x \quad y \quad 0]^T$, $S_2 : \mathbf{N} = [x \quad y \quad -z]^T$. b) $-1456\pi/3$.

a) $S_1 : \mathbf{N}_1 = \begin{pmatrix} x \\ y \\ 0 \end{pmatrix}$

$S_2 : \mathbf{N}_2 = \begin{pmatrix} x \\ y \\ -z \end{pmatrix}_{\text{outward}}$

b) Parameterise $S_2 : \vec{r}(r, \theta) = \begin{pmatrix} r \cos \theta \\ r \sin \theta \\ r \end{pmatrix}$

$$\mathbf{N} = \vec{r}_r \times \vec{r}_\theta = \begin{pmatrix} \cos \theta \\ \sin \theta \\ 1 \end{pmatrix} \times \begin{pmatrix} -r \sin \theta \\ r \cos \theta \\ 0 \end{pmatrix}$$

$$= \begin{pmatrix} -r \cos \theta \\ -r \sin \theta \\ r \cos^2 \theta + r \sin^2 \theta \end{pmatrix}$$

$$= \begin{pmatrix} -r \cos \theta \\ -r \sin \theta \\ r \end{pmatrix}_{\text{inward}}$$

$$\vec{N}_0 = \begin{pmatrix} r \cos \theta \\ r \sin \theta \\ -r \end{pmatrix}$$

$$\text{Flux} = \iint \vec{F} \cdot \vec{N}_0 \, d\mathbf{r} d\theta = \iint \begin{pmatrix} -r \sin \theta \\ r \cos \theta \\ r \end{pmatrix} \cdot \begin{pmatrix} r \cos \theta \\ r \sin \theta \\ -r \end{pmatrix} \, d\mathbf{r} d\theta$$

$$= \iint_0^9 -r^2 \, d\mathbf{r} d\theta$$

$$= -\int_0^{2\pi} d\theta \cdot \int_1^9 r^2 dr$$

$$= -2\pi \cdot \left[\frac{r^3}{3} \right]_1^9$$

$$= \frac{-1456\pi}{3}$$

Parameterise S_1 : $\vec{r}_0 = \begin{pmatrix} \cos \theta \\ \sin \theta \\ 0 \end{pmatrix}$

$$\begin{aligned} \text{Flux} : \iint \begin{pmatrix} -\sin \theta \\ \cos \theta \\ 0 \end{pmatrix} \cdot \begin{pmatrix} \cos \theta \\ \sin \theta \\ 0 \end{pmatrix} d\theta d\theta &= \iint 0 d\theta d\theta \\ &= 0 \end{aligned}$$

$$\therefore \text{Flux}_S = \text{Flux}_{S_1} + \text{Flux}_{S_2}$$

$$= \frac{-1456\pi}{3}$$

5. Use the divergence theorem to evaluate the flux of the vector field below through surface S of the unit cube in the domain $[0, 1] \times [0, 1] \times [0, 1]$.

integration
used in

$$\mathbf{V}(x, y, z) = [ze^{x^2} \quad 3y \quad 2 - yz]^T$$

ANS: Flux = $e/2 + 2$.

$$\begin{aligned}
 & \iiint_V \vec{\nabla} \cdot \vec{V} \, dV \\
 &= \iiint_V \left(\frac{\partial F_1}{\partial x} + \frac{\partial F_2}{\partial y} + \frac{\partial F_3}{\partial z} \right) dV \\
 &= \iiint_V (2xe^{x^2} + 3 - y) \, dV \\
 &= \int_0^1 \int_0^1 \int_0^1 (2xe^{x^2} + 3 - y) \, dz \, dy \, dx \\
 &= \int_0^1 \int_0^1 [xz^2 e^{x^2} + 3z - yz]_0^1 \, dy \, dx \\
 &= \int_0^1 \int_0^1 (xe^{x^2} + 3 - y) \, dy \, dx \\
 &= \int_0^1 \left[xye^{x^2} + 3y - \frac{y^2}{2} \right]_0^1 \, dx \\
 &= \int_0^1 \left(xe^{x^2} + \frac{5}{2} \right) dx \qquad \begin{array}{l} \text{let } x^2 = u \\ du = 2x \, dx \end{array} \\
 &= \int_0^1 \cancel{x} e^u \frac{du}{\cancel{2x}} + \int_0^1 \frac{5}{2} \, dx \\
 &= \frac{1}{2} (e^1 - e^0) + \frac{5}{2} \\
 &= \frac{e}{2} - \frac{1}{2} + \frac{5}{2} \\
 &= \frac{e}{2} + 2
 \end{aligned}$$

10. (<https://openstax.org/books/calculus-volume-3/pages/6-7-stokes-theorem>)

Use Stokes' theorem to evaluate the line integral below, where C is the curve given by $x = \cos t$, $y = \sin t$, $z = \sin t$, $0 \leq t \leq 2\pi$, traversed in the direction of increasing t .

$$\int_C [2xy^2z \, dx + 2x^2yz \, dy + (x^2y^2 - 2z) \, dz]$$

ANS: 0.

For curve C ,

$$\vec{r}(t) = \begin{pmatrix} \cos t \\ \sin t \\ \sin t \end{pmatrix} = \begin{pmatrix} x \\ y \\ z=y \end{pmatrix}$$

$$\vec{r}(0) = \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix} = \vec{r}(2\pi) \rightarrow C \text{ is closed}$$

$$\oint_C \underbrace{[2xy^2z \, dx + 2x^2yz \, dy + (x^2y^2 - 2z) \, dz]}_{\begin{pmatrix} 2xy^2z \\ 2x^2yz \\ x^2y^2 - 2z \end{pmatrix} \cdot \begin{pmatrix} dx \\ dy \\ dz \end{pmatrix} = \vec{F} \cdot d\vec{r}}$$

$$\begin{aligned} \text{Stokes' theorem} &= \iint_S \underbrace{(\vec{\nabla} \times \vec{F})}_{\vec{0}} \cdot \vec{N} \, dA \\ &= \iint_S 0 \, dA \\ &= 0 \end{aligned}$$

$$\begin{aligned} \Rightarrow \times \vec{F} &= \begin{pmatrix} \frac{\partial x}{\partial y} \\ \frac{\partial y}{\partial z} \\ \frac{\partial z}{\partial x} \end{pmatrix} \times \begin{pmatrix} 2xy^2z \\ 2x^2yz \\ x^2y^2 - 2z \end{pmatrix} \\ &= \begin{pmatrix} 2x^2y - 2x^2y \\ -(2xy^2 - 2xy^2) \\ 4xyz - 4xyz \end{pmatrix} \\ &= \begin{pmatrix} 0 \\ 0 \\ 0 \end{pmatrix} \end{aligned}$$

11. Use Stokes' theorem to evaluate the line integral below, where C is the intersection curve between the plane $x + y + z = 8$ and the cylinder $x^2 + y^2 = 9$, oriented counterclockwise.

$$\int_C \mathbf{F} \cdot d\mathbf{r}, \quad \mathbf{F}(x, y, z) = \begin{bmatrix} x^2 z \\ xy^2 \\ z^2 \end{bmatrix}$$

ANS: $81\pi/2$.

$$\iint_S (\nabla \times \vec{F}) \cdot \vec{N} dA$$

For curve C,

$$\vec{r}(x, y) = \begin{pmatrix} x \\ y \\ 8 - x - y \end{pmatrix}$$

$$\vec{r}_x = \begin{pmatrix} 1 \\ 0 \\ -1 \end{pmatrix}$$

$$\vec{r}_y = \begin{pmatrix} 0 \\ 1 \\ -1 \end{pmatrix}$$

$$\vec{N} = \begin{pmatrix} 1 \\ 0 \\ -1 \end{pmatrix} \times \begin{pmatrix} 0 \\ 1 \\ -1 \end{pmatrix} = \begin{pmatrix} 1 \\ 1 \\ 1 \end{pmatrix}$$

$$\nabla \times \vec{F} = \begin{pmatrix} \frac{\partial x}{\partial y} \\ \frac{\partial y}{\partial z} \\ \frac{\partial z}{\partial x} \end{pmatrix} \times \begin{pmatrix} x^2 z \\ xy^2 \\ z^2 \end{pmatrix}$$

$$= \begin{pmatrix} 0 \\ -(0 - x^2) \\ y^2 - 0 \end{pmatrix}$$

$$= \begin{pmatrix} 0 \\ x^2 \\ y^2 \end{pmatrix}$$

$$(\nabla \times \vec{F}) \cdot \vec{N} = \begin{pmatrix} 0 \\ x^2 \\ y^2 \end{pmatrix} \cdot \begin{pmatrix} 1 \\ 1 \\ 1 \end{pmatrix}$$

$$= x^2 + y^2$$

$$\iint (x^2 + y^2) dA = \iint (x^2 + y^2) dx dy$$

$$= \int_0^{2\pi} \int_0^3 (r^2) r dr d\theta$$

$$= \int_0^{2\pi} \left[\frac{r^4}{4} \right]_0^3 d\theta$$

$$= \int_0^{2\pi} \frac{81}{4} d\theta$$

$$= \left[\frac{81}{4} \theta \right] \Big|_0^{2\pi}$$

$$= \frac{81\pi}{2}$$

$\mathbf{F}(x, y, z) = \begin{bmatrix} e^{y+z} - 2y \\ ze^{y+z} + y \\ e^{y+z} \end{bmatrix}, S: \{(x, y, z) \mid z = e^{-(x^2+y^2)}, z \geq 1/e\}$

$\iint_S (\nabla \times \mathbf{F}) \cdot \vec{N} dA$ (ANS: 2π)

compute this! (but very tedious!)

relate to a simpler surface.

$\iint_S (\nabla \times \mathbf{F}) \cdot \vec{N} dA = \oint_C \mathbf{F} \cdot d\vec{r}$

$= \iint_{S_1} \left(\frac{\partial F_3}{\partial x} - \frac{\partial F_2}{\partial y} \right) \cdot \begin{pmatrix} 0 \\ 0 \\ 1 \end{pmatrix} dA$

$= \iint_{S_1} e^{y+z} - (e^{y+z} - 2) dA$

$= \iint_{S_1} 2 dA = 2 \times \text{Area of } S_1 = 2\pi(1)^2 = 2\pi$

Diagrams: A 3D plot of the surface S (a downward-opening paraboloid) and a 2D plot of the circular region S_1 in the xy -plane defined by $x^2 + y^2 = 1$. The region S_1 is shaded red. The boundary curve C is also shown.

parameterize S :

$$\vec{r}_s(t) = \begin{pmatrix} \cos t \\ \sin t \\ \frac{1}{e} \end{pmatrix}$$

$$\vec{r}'_s(t) = \begin{pmatrix} -\sin t \\ \cos t \\ 0 \end{pmatrix}$$

$$\oint \vec{F} \cdot d\vec{r} = \int_0^{2\pi} \begin{pmatrix} e^{\sin t + \frac{1}{e}} - 2\sin t \\ \cos t e^{\sin t + \frac{1}{e}} + \sin t \\ e^{\cos t + \sin t} \end{pmatrix} \cdot \begin{pmatrix} -\sin t \\ \cos t \\ 0 \end{pmatrix} dt$$
