Content

1. Types of oscillation
2. Simple Harmonic Motion (SHM)
3. Variation with time: *x*, *v*, *a* vs *t*.
4. Variation with displacement: *v*, *a* vs *x*.
5. Damped Oscillations
6. Forced Oscillations
7. * Oscillation Video Questions (about 20 questions)

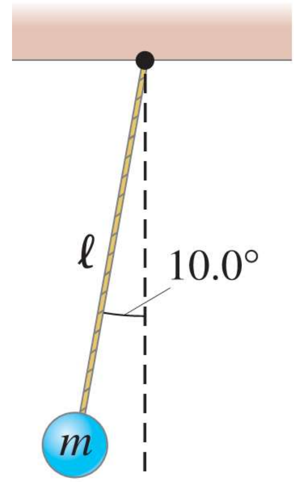
x: displacement
v: velocity
a: acceleration

1. Types of Oscillation

1. Simple Oscillating Pendulum
   https://www.youtube.com/watch?v=fTOuA2Y_IX0
2. Oscillating Spring: Horizontal & Vertical
3. Oscillating cylinder (floating in water)

Oscillations will go on forever if <u>undamped.</u>

<u>Damping:</u> Resistive forces acting on oscillation.



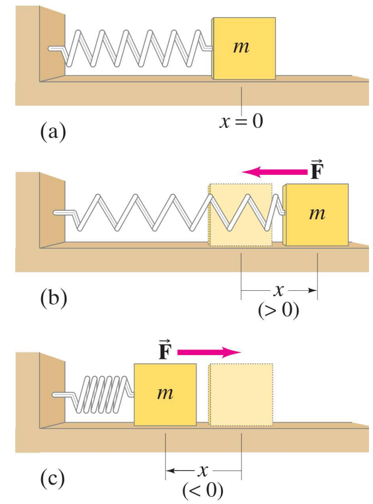


FIGURE 11–1 An object of mass m oscillating at the end of a uniform spring. The force $\vec{\mathbf{F}}$ on the object at the different positions is shown *above* the object.

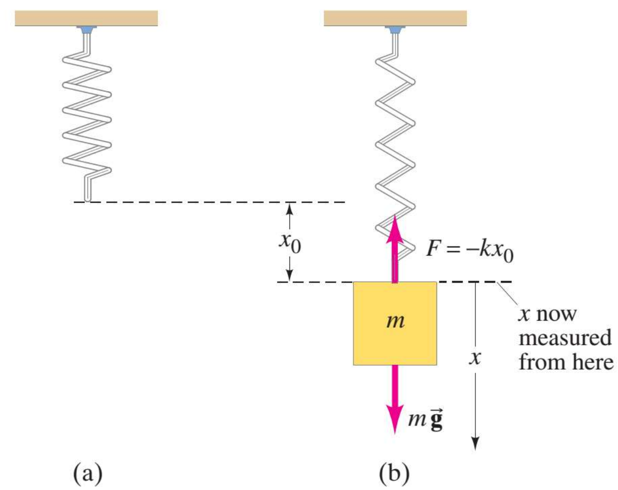

FIGURE 11–3
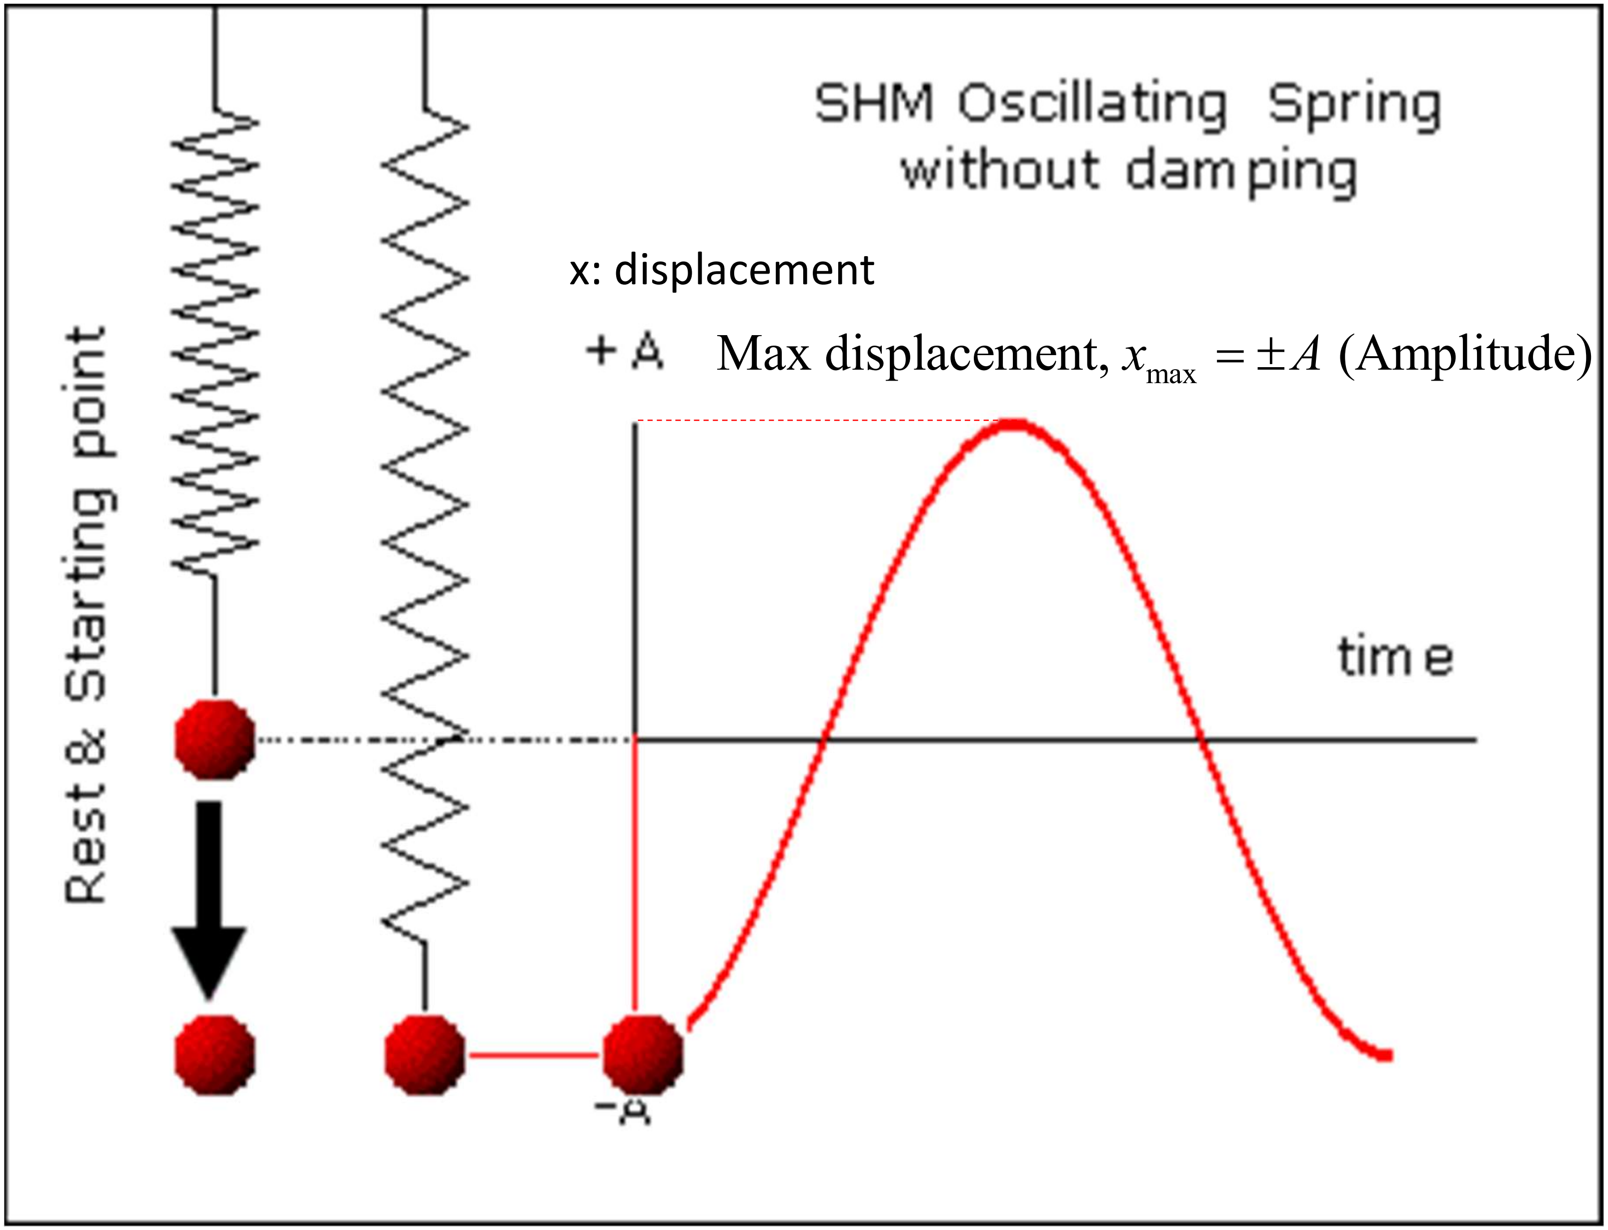
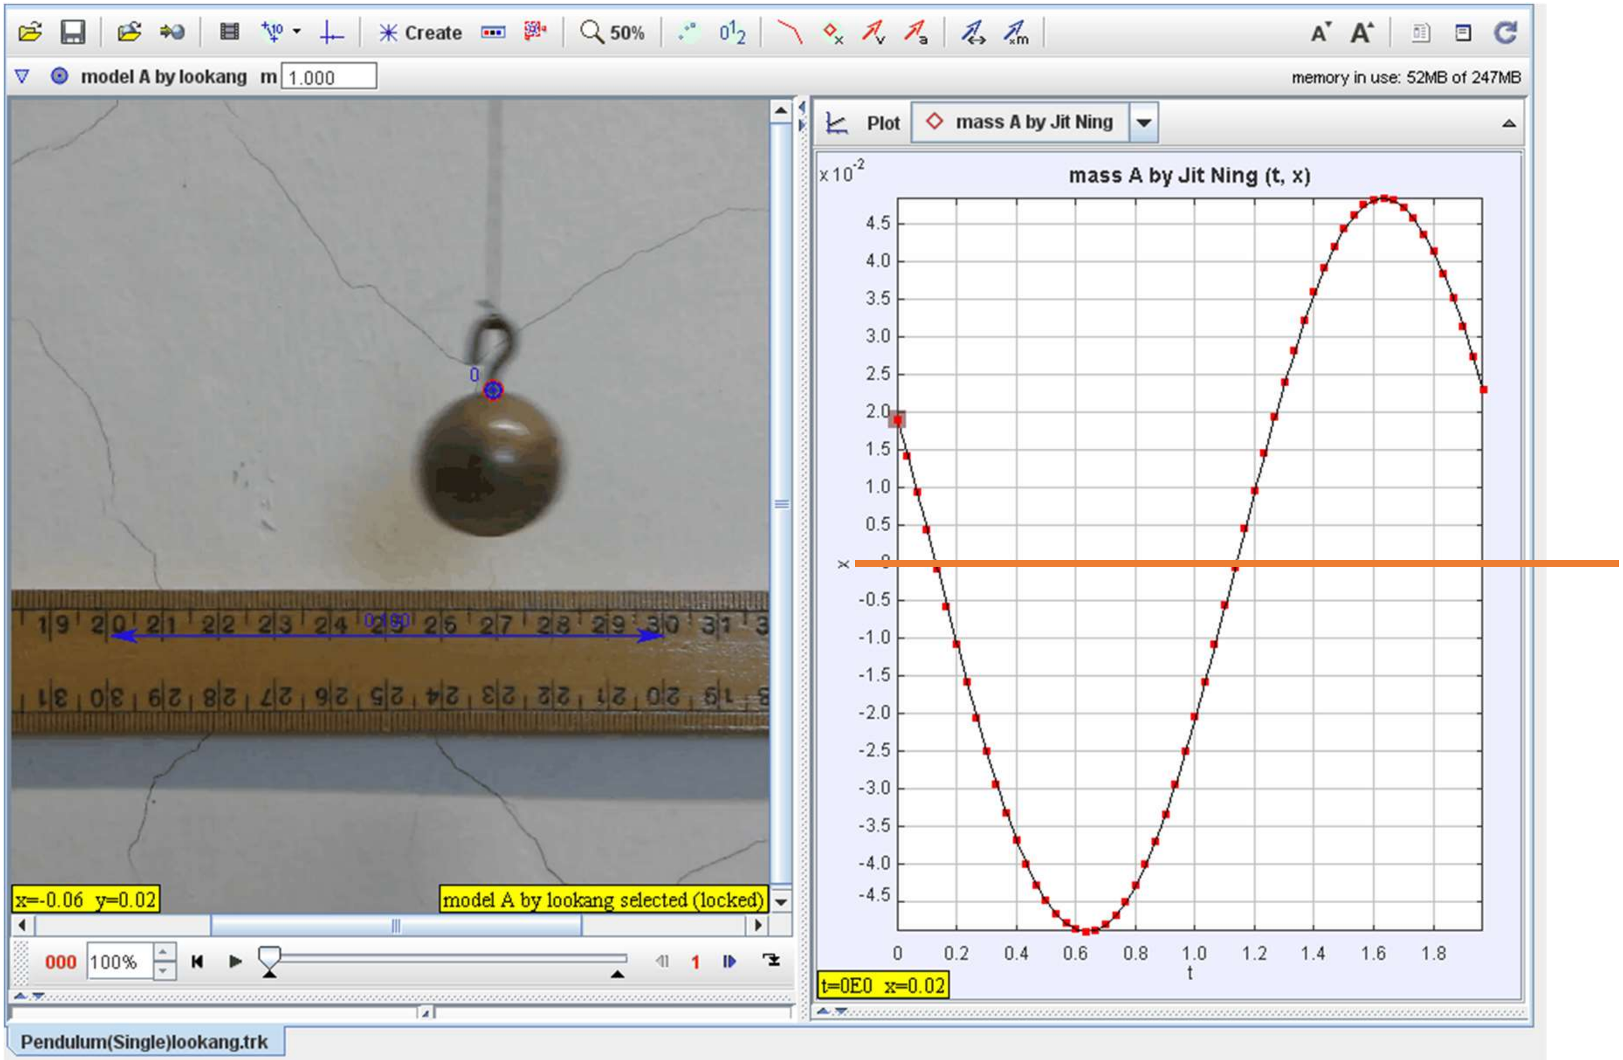
(a) Free spring, hung vertically.
(b) Mass m attached to spring in new equilibrium position, which occurs when $\Sigma F = 0 = mg - kx_0$.

https://askeyphysics.org/home/shm-spring-amplitude-gif/



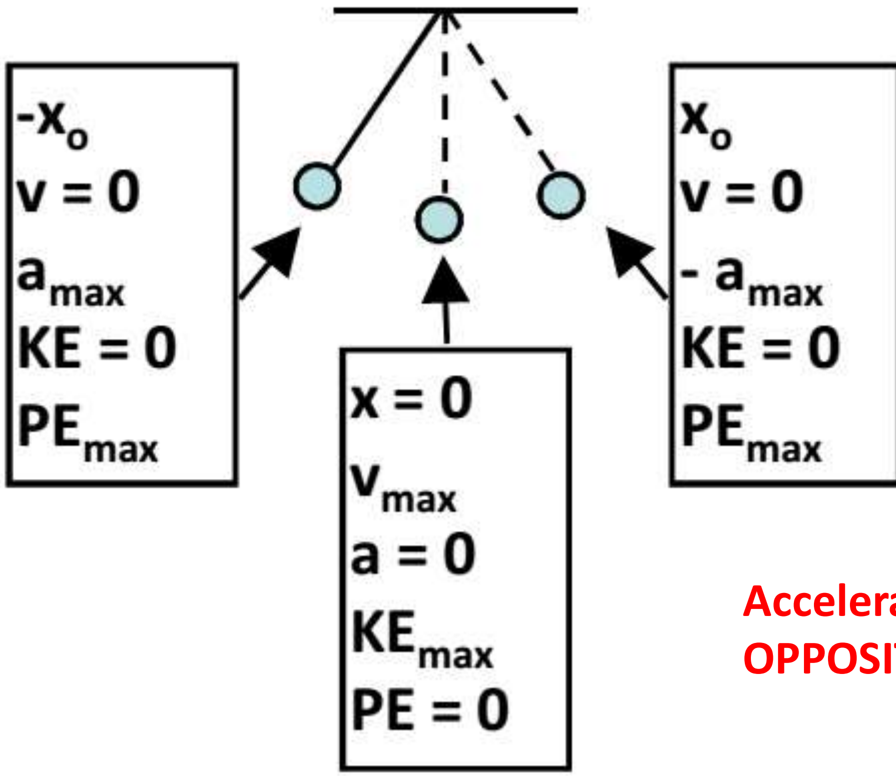
https://weelookang.blogspot.com/2017/04/tracker-animated-gifs-for-oscillations.html



1. Types of Oscillation

$$v = \frac{dx}{dt}$$

Simple Oscillating Pendulum



$$a = \frac{dv}{dt}$$

Acceleration & **Velocity** are in **OPPOSITE DIRECTIONS**

Define: Equilibrium position as x = 0

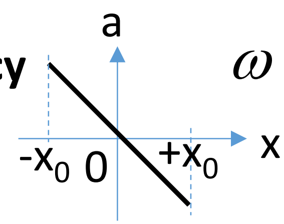
Total Energy, TE= KE+PE

No resistive force: Total energy is constant

2. Simple Harmonic Motion (SHM)

1. Defining equation $[\ a = -\omega^2 x\ ]$

Angular frequency $\omega = 2\pi f = \dfrac{2\pi}{T}$



2. SHM : An object in an oscillatory motion with acceleration **directly proportional** to displacement from its equilibrium point (x=0) **and** always directed towards that equilibrium point.

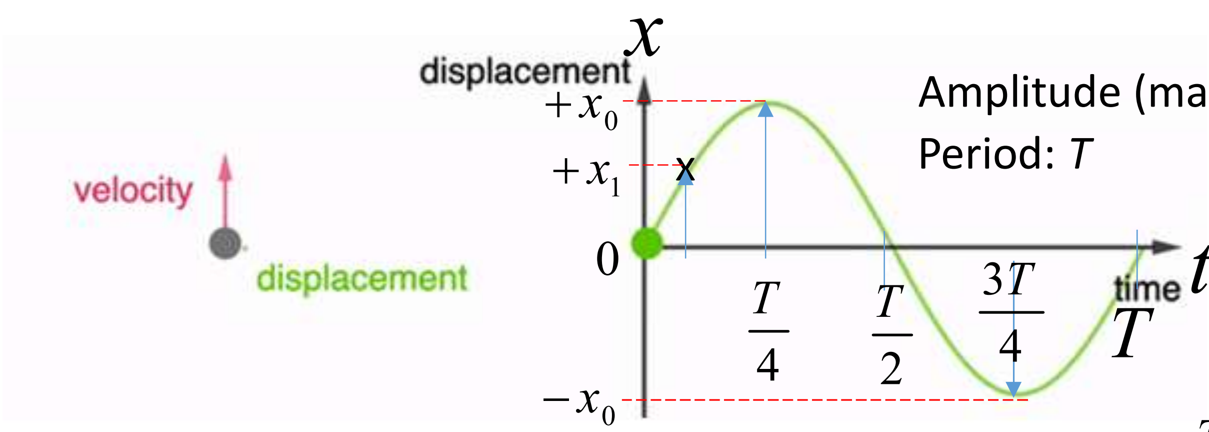
3. Equilibrium Position: Usually $x = 0$. (a will be ZERO) Newton's 2nd Law (At equilibrium position, resultant force $R = 0$) because $ma = 0$

4. Other terms:
   i. Period (T) & Frequency (f): Period is fixed regardless of amplitude.
   ii. Displacement x
   iii. Amplitude: Max. displacement $x = x_0$ from equilibrium position.
   iv. Phase: 2 oscillating bodies are in-phase or out-of-phase

f is natural frequency of system that depends on system properties.
E.g. f of **mass-spring system** depends on mass m and spring constant k.

From Newton's 2nd Law

$$f = \frac{1}{2\pi}\sqrt{\frac{k}{m}} \Rightarrow T = 2\pi\sqrt{\frac{m}{k}}$$



Amplitude (max displacement): $\pm x_0$

Period: *T*

$$x = x_0 \sin \omega t$$

$$x = x_0 \sin \left(\frac{2\pi}{T} \right) t$$

At time $\frac{T}{4}$, $\quad x = x_0 \sin \left(\frac{2\pi}{T} \right) \left(\frac{T}{4} \right) = +x_0$

At time $\frac{3T}{4}$, $\quad x = x_0 \sin \left(\frac{2\pi}{T} \right) \left(\frac{3T}{4} \right) = -x_0$

STARTING CONDITION:

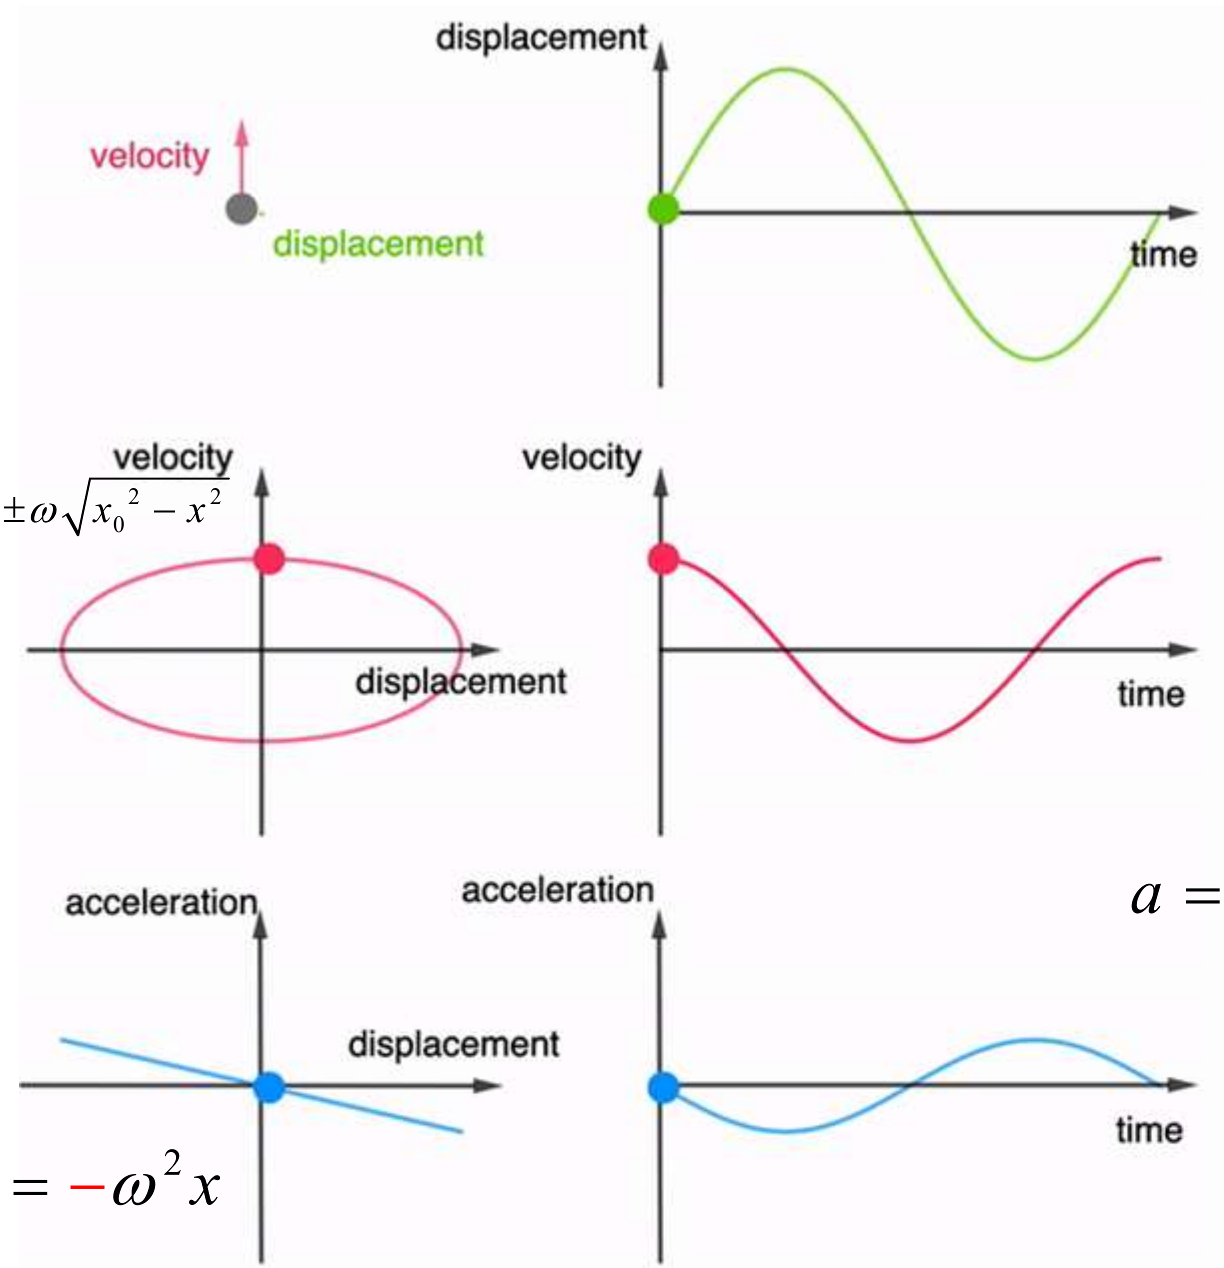
$$x = 0 \text{ at } t = 0$$

At time 0.7*T* ,

$$x = x_0 \sin \left(\frac{2\pi}{T} \right) (0.7T) = -0.95 x_0$$

Check: When using angles in degrees, make sure calculator in DEGREE mode
When using radians, make sure calculator in RADIAN mode.

https://www.physicslens.com/category/a-level-topics/10-oscillations/



$$x = x_0 \sin \omega t \quad \text{----(1)}$$

$$v = \pm\omega\sqrt{x_0^{\,2} - x^2}$$

$$v = \frac{dx}{dt} = x_0 \omega \cos \omega t$$

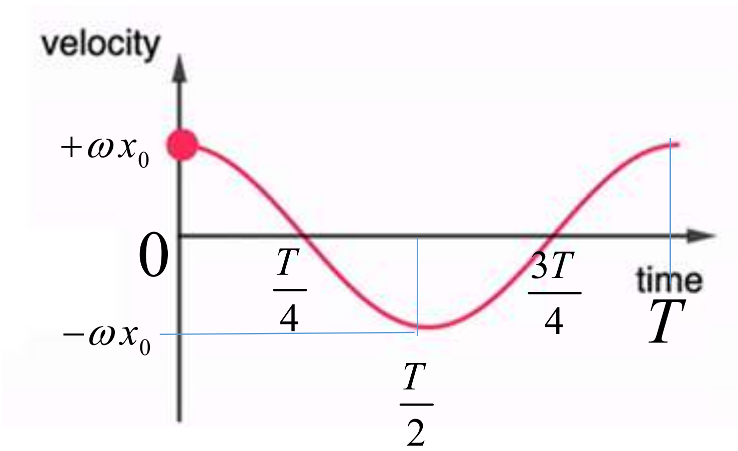
$$v = x_0 \omega \cos \omega t \quad \text{----(2)}$$

Square Eqn(1) & Eqn(2)

$$a = \frac{dv}{dt} = -x_0 \omega^2 \sin \omega t$$

$$a = -\omega^2 \left[x_0 \sin \omega t \right]$$

$$a = -\omega^2 x$$



$$x = x_0 \sin \omega t$$

$$x = x_0 \sin\left(\frac{2\pi}{T}\right)t$$

Constants:

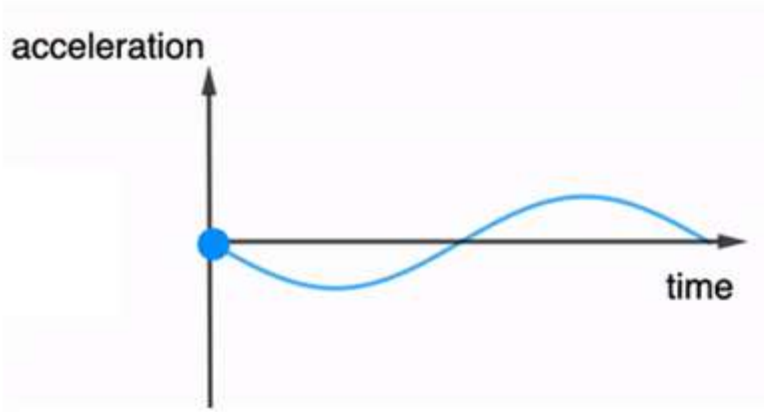
$x_0 \quad \omega$

$$v = \frac{dx}{dt} = \omega x_0 \cos \omega t \Rightarrow \boxed{v = \omega x_0 \cos\left(\frac{2\pi}{T}\right)t}$$

$$v_{\max} = \pm\omega x_0$$

At time t = 0 , cos (0) = 1 $v_{\max} = +\omega x_0$

At time $\frac{T}{2}$, $\cos\pi = -1$ $v_{\max} = -\omega x_0$



$$v = \frac{\mathrm{d}x}{\mathrm{d}t} = \omega x_0 \cos \omega t \Rightarrow v = \omega x_0 \cos\left(\frac{2\pi}{T}\right)t$$

$$a = \frac{\mathrm{d}v}{\mathrm{d}t}$$

$$v = \omega x_0 \cos \omega t$$

$$a = \frac{\mathrm{d}v}{\mathrm{d}t} = (\omega x_0)(\omega)(-\sin \omega t)$$

$$a = -\omega^2 x_0 \sin \omega t \quad \text{-----(1)}$$

$$x = x_0 \sin \omega t \quad \text{-----(2)}$$

Sub Eqn (2) into Eqn (1): $a = -\omega^2 x$

TRY ON YOUR OWN

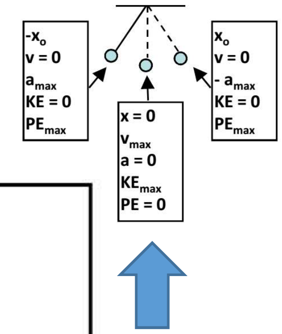
$$x = x_0 \cos \omega t$$

OR $$x = -x_0 \cos \omega t$$

3. Variation with time: x, v, a **vs** t.

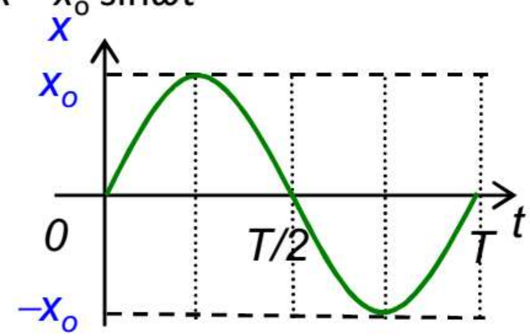
Graphs & equations VARY with initial settings.

Eg. When <u>started from equilibrium</u> (At $t = 0$, $x = 0$, $v = v_o$)

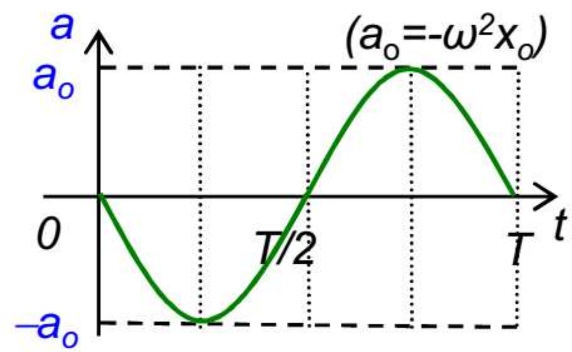


Start here.

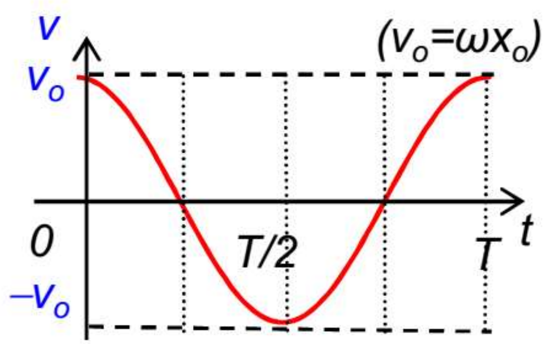
$x = x_o \sin\omega t$



$a = -\omega^2 x_o \sin\omega t = -\omega^2 x$



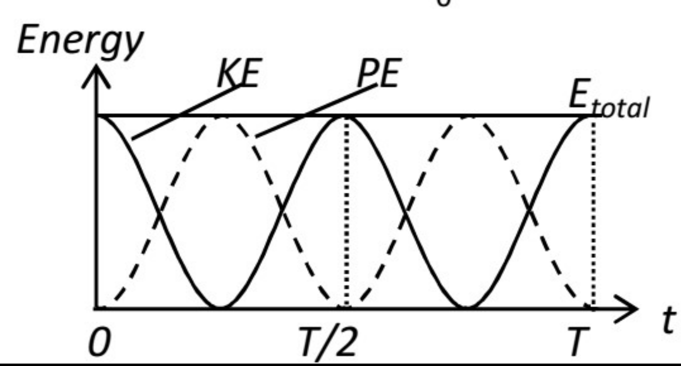
$v = \omega x_0 \cos\omega t = v_o \cos\omega t$



$KE = \frac{1}{2} m\omega^2 x_0^2 \cos^2\omega t$

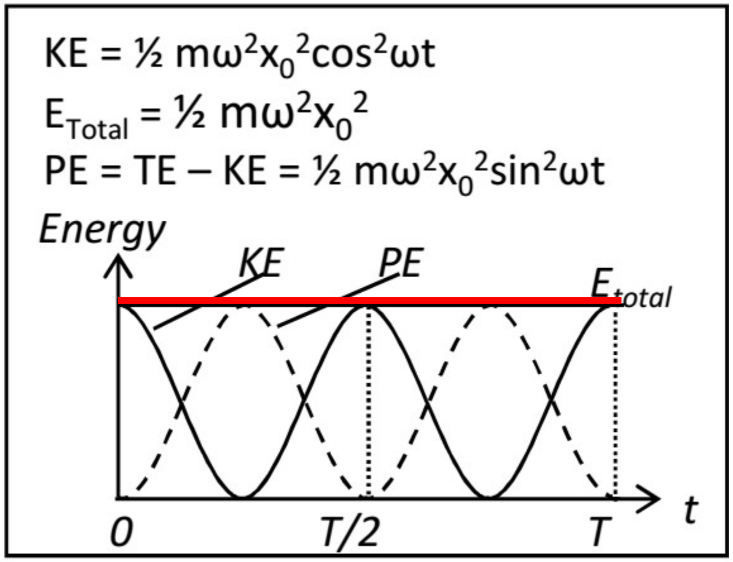
$E_{Total} = \frac{1}{2} m\omega^2 x_0^2$

$PE = TE - KE = \frac{1}{2} m\omega^2 x_0^2 \sin^2\omega t$



Graphs & equations VARY with initial settings.

Eg. When <u>started from equilibrium</u> (At $t = 0$, $x = 0$, $v = v_o$)



$$x = x_0 \sin \omega t$$

$$v = \omega x_0 \cos \omega t$$

m: Mass of oscillating object

$$KE = \frac{1}{2} m v^2 = \frac{1}{2} m \left(\omega x_0 \cos \omega t\right)^2$$

$$KE = \frac{1}{2} m \omega^2 x_0^2 \cos^2 \omega t$$

$$Total\ E = \frac{1}{2} m \omega^2 x_0^2$$ (Constant with t)

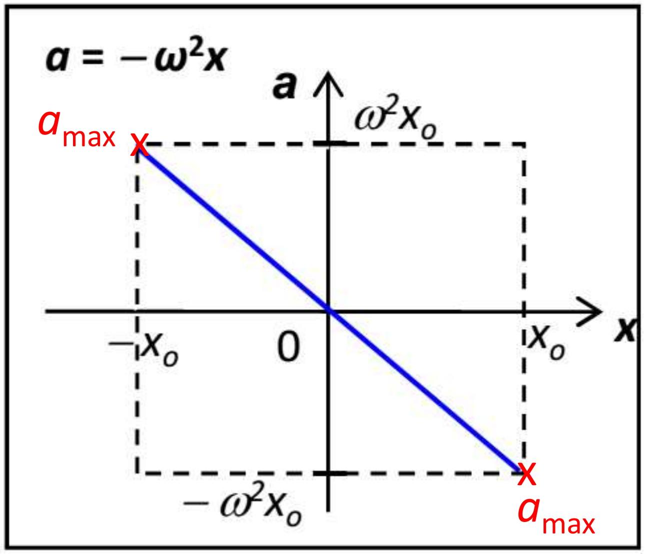
$$PE = \frac{1}{2} m \omega^2 x_0^2 - \frac{1}{2} m \omega^2 x_0^2 \cos^2 \omega t$$

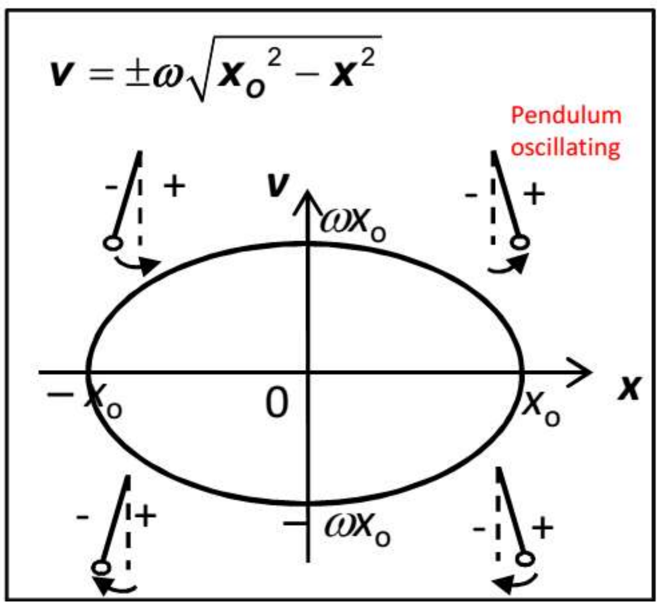
$$= \frac{1}{2} m \omega^2 x_0^2 \left(1 - \cos^2 \omega t\right)$$

$$\Rightarrow PE = \frac{1}{2} m \omega^2 x_0^2 \sin^2 \omega t \qquad \left[PE = \frac{1}{2} m \omega^2 x^2 \right]$$

$$\sin^2 \omega t + \cos^2 \omega t = 1 \Rightarrow \sin^2 \omega t = 1 - \cos^2 \omega t$$

4. Variation with displacement: v, a **vs** x.





Que

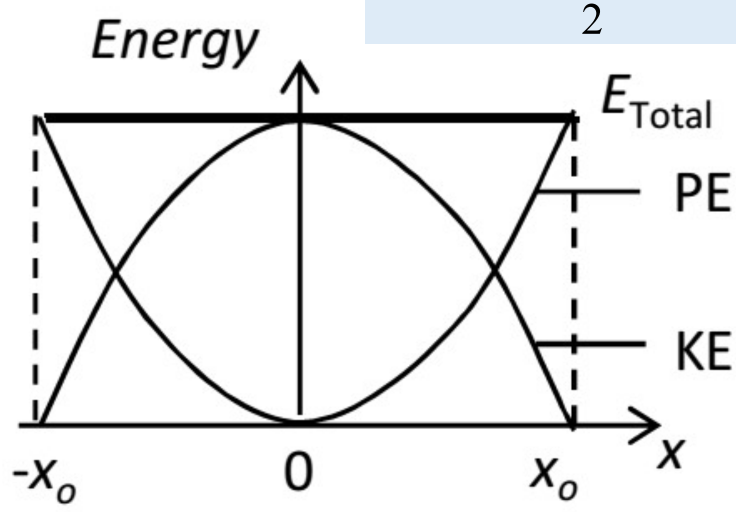
How

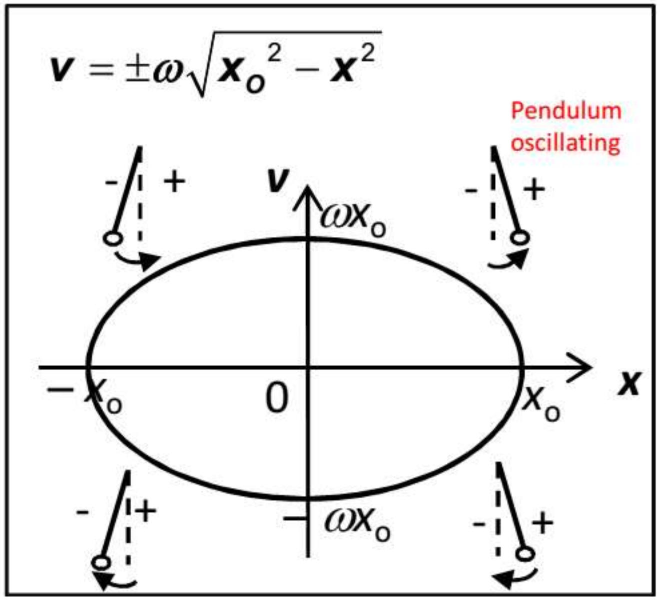
$$E_{Total} = KE + PE = \tfrac{1}{2} mv^2 + \tfrac{1}{2} kx^2$$

$$= \tfrac{1}{2} m\omega^2 (x_o^{\,2} - x^2) + \tfrac{1}{2} m\omega^2 x^2$$

$$= \tfrac{1}{2} m\omega^2 x_o^{\,2}$$

$$\Rightarrow PE = \frac{1}{2} m \omega^2 x^2$$





$$x = x_0 \sin \omega t$$

$$\Rightarrow \sin \omega t = \frac{x}{x_0} \quad \text{----(1)}$$

$$\sin^2 \omega t = \left(\frac{x}{x_0}\right)^2 \quad \text{----(1a)}$$

$$v = \omega x_0 \cos \omega t$$

$$\Rightarrow \cos \omega t = \frac{v}{\omega x_0} \quad \text{-------(2)}$$

$$\cos^2 \omega t = \left(\frac{v}{\omega x_0}\right)^2 \quad \text{-------(2a)}$$

$$\sin^2 \omega t + \cos^2 \omega t = 1$$

Eqn(1a) + Eqn(2a):

$$\left(\frac{x}{x_0}\right)^2 + \left(\frac{v}{\omega x_0}\right)^2 = 1 \qquad \Rightarrow \frac{\omega^2 x^2 + v^2}{\omega^2 x_0^{\,2}} = 1$$

$$\Rightarrow \omega^2 x^2 + v^2 = \omega^2 x_0^{\,2}$$

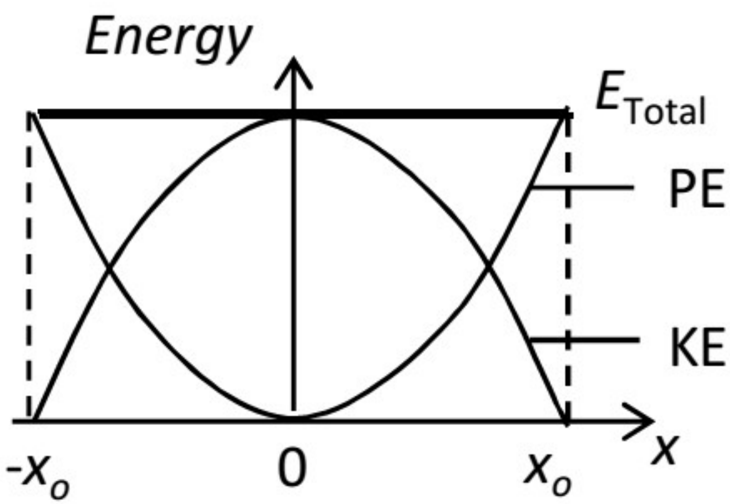
$$\Rightarrow v^2 = \omega^2 x_0^{\,2} - \omega^2 x^2$$

$$\Rightarrow v = \pm\omega\sqrt{x_0^{\,2} - x^2}$$

$$E_{Total} = KE + PE = \tfrac{1}{2} mv^2 + \tfrac{1}{2} kx^2$$

$$= \tfrac{1}{2} m\omega^2(x_o^2 - x^2) + \tfrac{1}{2} m\omega^2 x^2$$

$$= \tfrac{1}{2} m\omega^2 x_o^2$$



$$KE = \frac{1}{2} m\omega^2 x_0^2 \cos^2 \omega t$$

$$KE = \frac{1}{2} m\omega^2 x_0^2 \left(1 - \sin^2 \omega t\right)$$

$$KE = \frac{1}{2} m\omega^2 x_0^2 - \frac{1}{2} m\omega^2 x_0^2 \sin^2 \omega t$$

$$KE = \frac{1}{2} m\omega^2 x_0^2 - \frac{1}{2} m\omega^2 x^2$$

$$\text{Total}\, E = \frac{1}{2} m\omega^2 x_0^2$$ CONSTANT with t

$$PE = \frac{1}{2} m\omega^2 x_0^2 \sin^2 \omega t$$

$$PE = \frac{1}{2} m\omega^2 \left(x_0 \sin \omega t\right)^2$$

$$PE = \frac{1}{2} m\omega^2 x^2$$

Question from class

MUHAMMAD NORAFFIQ BIN MOHD ... to Everyone 10:04 AM

MN sir velocity will always be cosine?

Question 2: Object oscillating vertically on spring

Produce equations & graphs when object is displaced downwards from equilibrium and released (i.e. at $t = 0$, $x = + x_o$, $v = 0$)

Means starting graph is **cosine displacement-time graph** (when t = 0, x = x_0)

$$x = x_0 \cos \omega t \qquad v = -x_0 \omega \sin \omega t$$

$$a = -x_0 \omega^2 \cos \omega t$$

$$a = -\omega^2 \left(x_0 \cos \omega t \right) = -\omega^2 x$$

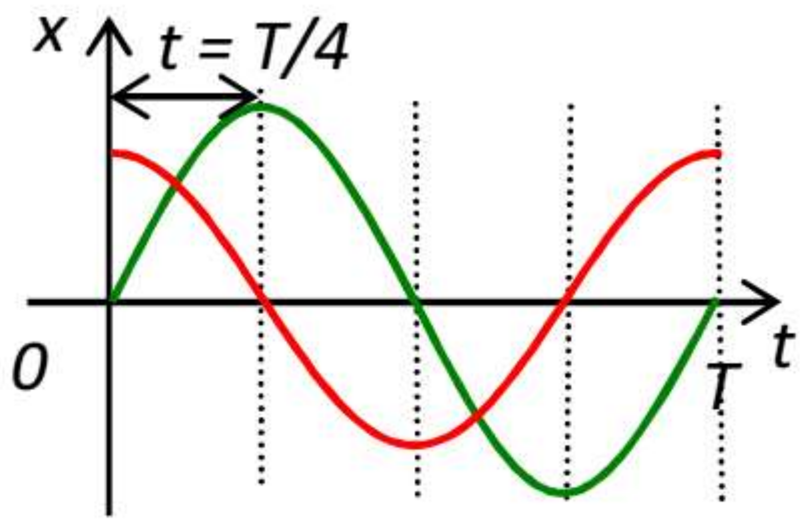
Comparing 2 oscillations with SAME frequency f.

When comparing oscillations of same frequency,

Phase difference: $\Delta\phi = \left(\dfrac{2\pi}{T}\right)t$

1. In phase: $\Delta\phi = 0$ or 2π rad
2. In anti-phase: $\Delta\phi = \pi$ rad out of phase

***Example: What is phase difference ($\Delta\phi$) for oscillations below?**



Answer:

$$\Delta\phi = \left(\frac{2\pi}{T}\right)\left(\frac{T}{4}\right) = \frac{\pi}{2} \text{ rad.}$$

Question 3

If the frequency of a system undergoing simple harmonic motion doubles, by what factor does the maximum value of acceleration change?

Answer: 4 times

$\omega = 2\pi f$

$a = -\omega^2 x$

$a_1 = -\omega_1^2 x \qquad \omega_1 = 2\pi(2f)$

$a_1 = -(2\pi(2f))^2 x = -4[(2\pi f)^2 x] = -4\omega^2 x = -4a$

Question 4

A point on the string of a violin moves up and down in simple harmonic motion with an amplitude of 1.24 mm and a frequency of 875 Hz.
(a) What is the maximum speed of that point in SI units?
(b) What is the maximum acceleration of the point in SI units?

Answer: (a) 6.82 m/s (b) -3.75 x 10^4 m/s^2

$x = x_0 \sin \omega t$

$x_0 = 1.24 \times 10^{-3}$ m $\quad f = 875$ Hz

$\omega = 2\pi(875)$

$\frac{dx}{dt} = x_0 \omega \cos \omega t$

$v_{max} = x_0 \omega$ when $\cos \omega t = 1$

$a_{max} = -x_0 \omega^2$ when $\sin \omega t = 1$

$\frac{d^2x}{dt^2} = -x_0 \omega^2 \sin \omega t$

$v_{max} = 1.24 \times 10^{-3} \times 2\pi(875)$

$= 6.82$ m/s

$a_{max} = -3.75 \times 10^4$ m/s^2

Question 5

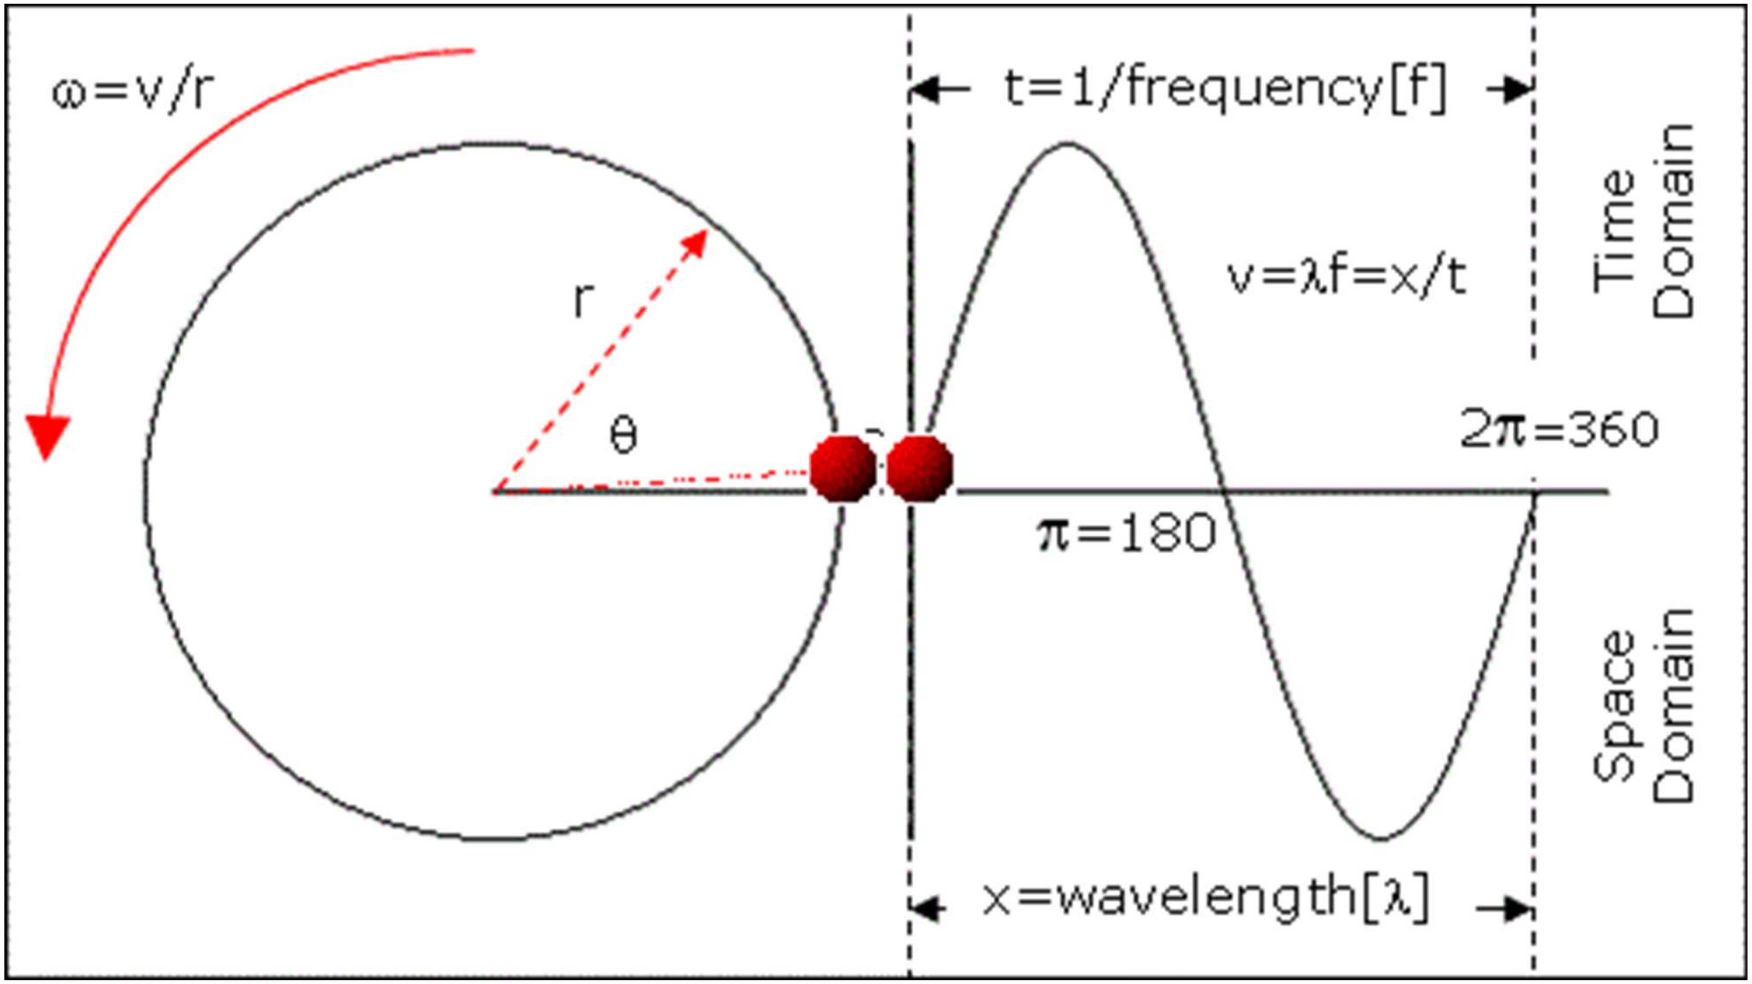
A mass, suspended from the end of a spring, is oscillating with SHM.
If the angular frequency is 2.0 rad s^{-1}, what is the period of the oscillation?

Answer: 3.1 s

$$T = \frac{2\pi}{\omega} = \frac{2\pi}{2.0}$$

$$= 3.1 s$$

https://br.pinterest.com/pin/595812225677553800/



Compare with circular motion

Summary

1. Equations of motion of SHM (x, v, a versus t) when oscillation starts at (a) $x = 0$ at $t = 0$ s **(b)** $\boldsymbol{x = \pm x_0}$ **at** $\boldsymbol{t = 0}$ **s.**

2. Corresponding graphs for No. 1 above.

3. Derive equations relating v & x.

$$\Rightarrow v = \pm\omega\sqrt{x_0^{\,2} - x^2}$$

4. Derive equations relating KE, PE and TE (Total energy) with t & x.

$$a = -\omega^2 x$$
